     this.belongsTo(Userdatainfo, { foreignKey: "u
                                                         pic path: {
                                                           type: DataTypes.STRING,
                                                           allowNull: false
                                                           type: DataTypes.INTEGER,
                                                           allowNull: false
                                                           type: DataTypes.INTEGER,
    toJSON() {
                                                           allowNull: false
      return { ...this.get(), id: undefined };
                                                           type: DataTypes.DATE,
                                                           allowNull: false
```

NODEJS-SEQUELIZE-MYSQL

- sequelize is translation layer between nodejs and the db
- define model objects
- define model associations
- no raw query strings (select * from...)
- migrate to db
- possibility to setup seeders
- possibility to nest objects
- single language (js in our case)

./SRC/PROJECT/BCRYPT

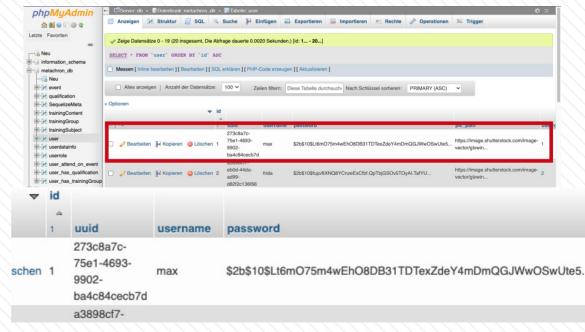

./SRC/PROJECT/BCRYPT

SECURE INFORMATION

node.bcrypt.js

bcrypt to hash information to db (for example password)
(in our case saltrounds = 10)

./SRC/PROJECT/INSOMNIA-API-CLIENT

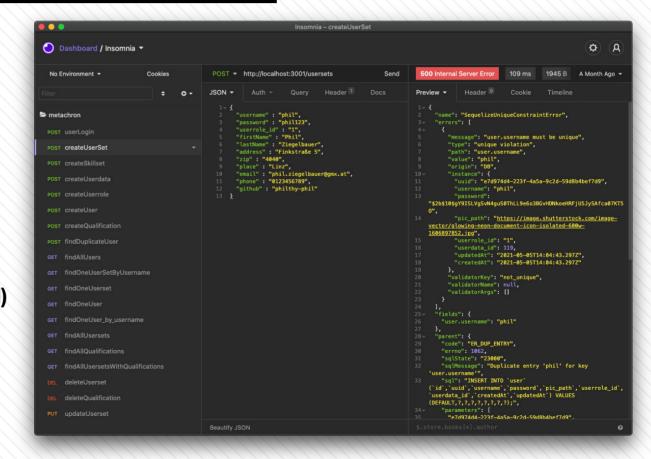

./SRC/PROJECT/INSOMNIA

SECURE INFORMATION

- insomnia is a api-client (like postman just for free)
- testing our api routes (backend)
- CRUD routes
